SAR OF LOCAL ANESTHETICS

Hydrophobic Intermediate Alkyl Chain Hydrophilic

- The structure of most of the useful local anesthetics contain hydrophilic and hydrophobic groups that are usually separated by an intermediate alkyl chain
- The hydrophilic group is usually a tertiary amine.
- The hydrophobic groups usually aromatic residue.
- In almost of all cases the linkage between the aromatic group chain is either of the ester or amide type and nature of the attachment of certain pharmacological properties of these

Five general groups of steroid hormones are discussed:

Typically, endocrinologists classify steroid hormones into five groups of molecules, based primarily on the receptor to which they bind:

1. Glucocorticoids; cortisol is the major representative in most mammals
2. Mineralocorticoids; aldosterone being most prominent
3. Androgens such as testosterone
4. Estrogens, including estradiol and estrone
5. Progestogens (also known as progestins) such as progesterone
